

How I Hunt for Ideas

Idea Generation, step by step — a 2–4 year holder chasing underappreciated growth, cheap quality compounders, and sectors poised to re-rate.

None of these signals tell me what to buy. They tell me where to look.

Each one is a tripwire — a place where the market, a company, or an insider is signalling that something may have changed. My edge is never in the signal; it is in what I do after it trips: I go dig for whether a durable 2–4 year story sits underneath. Price and news flag the candidate; fundamentals deliver the verdict.

Part 1 · Why I look at each signal

Where the market is reacting

These compress the universe. I can't read every company every day, so I let price tell me where attention is concentrating.

52-Week High / Low

New highs — don't mistake them for "missed".

The beginner sees a new high and thinks he's too late. I see the opposite: winners keep winning while earnings compound, and a fresh high is often the **start** of a re-rating, not the end — the market just beginning to wake up to growth I may have spotted earlier. A new high filters for businesses where reality is beating expectations.

New lows — a hunting ground, with a trap.

The lows list is where I hunt for **mispriced quality**: a good business temporarily out of favour, where short-term fear creates a long-term entry. But the trap comes first — **most** new lows are deserved. I go to the lows looking for the rare exception, not to go shopping.

Gainers

A sharp gain means the market is reacting to **new information today**. It doesn't tell me to buy — it asks me a question: *what just changed, and is it durable or a one-day pop?* The gain is only the prompt to go find the why.

Losers

A sharp fall asks the mirror question: *is this real deterioration I should avoid, or an overreaction I can buy?* On a quality name, fear-driven selling is often where my cheapest entry into a compounder appears. Again — I investigate the why before touching it.

What actually changed

News

News is my **widest, earliest sensor**. It catches demand shifts, capex cycles, policy and budget moves, supply constraints — often before price reacts at all. I read facts and throw away opinion, because opinion is noise and events are what change fundamentals. I scan with keywords so the signal finds me, instead of me reading everything.

Corporate Announcements

Announcements are the **authoritative** version of the same information — primary-source, straight from the company, hardest to distort. If news is the early whisper, the announcement is the confirmation and the hard number. For my kind of investing, an **orderbook or capex announcement is leading evidence of growth before it ever lands in reported earnings** — and that is exactly the window I want to buy in.

Who is betting

Insider Buying

Promoters and management know the business better than any analyst ever will. When they put their **own money** in — especially clustered, open-market buying — it is the cleanest signal that the future is better than today's price implies. They can see the pipeline and the demand the market hasn't priced yet.

I lean almost entirely on **buying**. Selling is noisy — a house, a tax bill, diversification — so I read very little into it.

Which way the current flows

Industry Headwinds & Tailwinds

This is the weather. A great company in a declining industry spends its life fighting gravity; an average one in a powerful tailwind gets carried. So I find the sectors with **structural tailwinds** — policy support, a demand cycle turning up, a capex super-cycle, supply consolidation — and concentrate my hunting there, because **re-ratings happen at the sector level first**.

A tailwind de-risks the whole thesis — I'm swimming with the current. A headwind is my early warning against a value trap.

The market is loud about price and quiet about value.

These signals just tell me where the noise is. My job is to walk over and check whether there is something valuable making it.

Part 2 · The keywords I scan for

News scan — keywords by strength

STRONG · 3 pts	Demand · Capex · Approval · Trigger · Growth
MEDIUM · 2 pts	Supply · Constraints · Budget · Manufacturing
LIGHT · 1 pt	Valuations · MOAT (<i>opinion-prone — really Step 2</i>)
FLAG · 0 pts	Issue (<i>problem sense — read, don't score</i>)

Corporate announcements — keywords by type

VALUE · 3 pts	Results · Orderbook Update · Capex announcement
RAISE · 2 pts	QIP · Rights Issue (<i>read why they're raising</i>)
ACTION · 1 pt	Bonus · Split (<i>liquidity/sentiment, not value</i>)
FLUFF · capped	Business Update · General Update (<i>one count only</i>)

Part 3 · How I score it — repetition scoring

Every signal carries a flat point value. A name earns points **each time a signal fires on it**; points accumulate across signals and sessions, and the highest running total floats to the top. **Convergence is the signal** — when many independent tripwires land on the same name, that's where I look hardest.

Signal	Points	How it counts
Insider buying	5	Per disclosed open-market buy (selling = flag only)
52-week high / low — first appearance	5	The fresh breakout is the real tell
52-week high / low — each repetition	+1	Per session it stays on the list
News keyword — strong / medium / light	3 / 2 / 1	Per new development; same story across papers = once
Announcement — value / raise / action	3 / 2 / 1	Per event
Daily gainer / loser	1	Per session on the list
Industry tailwind (sector context)	+2	If the name sits in a flagged tailwind sector
Industry headwind (sector context)	-2	Early warning — discount the score
Business / General update	1*	*Capped — one count per window, no accumulation

The rules that keep it honest:

- **Window:** a rolling 21 trading sessions (~1 month). Each session adds points; the oldest rolls off the back.
- **Count per signal, per session** — not per mention. The same story echoed across ten papers on one day counts once.

- **Repetition across days accumulates** — persistence is meaningful; a fresh breakout that holds keeps earning.
- **Fluff is capped** — a "General Update" filed every week never climbs the board.
- **Volume is a confirmer**, not a standalone — a move on heavy volume can multiply a price signal by ~1.5x.

A signal is a question, never an answer.

The score just ranks my questions — it decides what I investigate first, not what I own. The buying decision always waits for the fundamental work.
